

# Sampling & Recycle Unit

The cabinet is connected to the fuel storage tank and dispenser unit by solid pipes

The fuel can be sampled in a closed system, avoiding spill and unsafe operation. After sample has been taken and controlled, the sample fuel will be stored on a tank in the cabinet. The jet fuel will be filtered and cleaned before transferred to jet fuel storage tank.

Our standard design is based on a stainless steel drip tray/base frame and enclosed with aluminium shelter of high offshore quality. This gives the unit a minimal need for maintenance.
